

I'm not robot!

not clear, use caution. Use Caution/Monitor.hydroxyzineMonitor Closely (1)hydroxyzine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.iloperidoneMonitor Closely (1)iloperidone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)iloperidone decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.mipramineMonitor Closely (1)mipramine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)mipramine, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.indacaterol, inhaledMonitor Closely (1)dopamine increases effects of indacaterol, inhaled by Other (see comment). Use Caution/Monitor. Comment: If additional adrenergic drugs are to be administered by any route, they should be used with caution because the sympathetic effects of indacaterol may be potentiated.isavuconazonium sulfateMinor (1)isavuconazonium sulfate will increase the level or effect of dopamine by Other (see comment). Minor/Significance Unknown. Isavuconazonium sulfate, an OCT2 inhibitor, may increase the effects or levels of OCT2 substrates.isocarboxazidContraindicated (1)isocarboxazid increases effects of dopamine by pharmacodynamic synergism. Contraindicated. Risk of acute hypertensive episode.isofluraneSerious - Use Alternative (1)isoflurane increases toxicity of dopamine by Mechanism: unknown. Avoid or Use Alternate Drug. Risk of V tach, HTN.isoproterenol and dopamine both decrease sedation. Use Caution/Monitor. isoproterenol and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.ketotifen, ophthalmicMonitor Closely (1)ketotifen, ophthalmic increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.levulbuterolMonitor Closely (2)levulbuterol and dopamine both decrease sedation. Use Caution/Monitor. levulbuterol and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.levorphanolMonitor Closely (1)levorphanol increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.linezolidContraindicated (1)linezolid increases effects of dopamine by pharmacodynamic synergism. Contraindicated. Risk of acute hypertensive episode.lisdexamfetamine and dopamine both decrease sedation. Use Caution/Monitor. dopamine and lisdexamfetamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.lisurideMon Closely (2)lisuride, dopamine. Either increases effects of the other by pharmacodynamic synergism. Use Caution/Monitor. dopamine and lisuride both increase dopaminergic effects. Use Caution/Monitor.lofepramineMonitor Closely (1)lofepramine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)lofepramine, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.lofexidineMonitor Closely (1)lofexidine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.lorazepamMonitor Closely (1)lorazepam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.lorazepamMonitor Closely (1)lorazepam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.lormetazepamMonitor Closely (1)lormetazepam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.loxapineMonitor Closely (1)loxapine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)loxapine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.lurasidoneContraindicated (1)dopamine increases toxicity of lurasidone by Other (see comment). Contraindicated. Comment: Interaction applies only in setting of acute lurasidone overdose. Epinephrine may enhance hypotensive effects of lurasidone in overdose setting.maprotilineMonitor Closely (1)maprotiline increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)maprotiline, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.marijuanaMonitor Closely (1)marijuana increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.melatoninMonitor Closely (1)melatonin increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.meperidineMonitor Closely (1)meperidine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.meprobamateMonitor Closely (1)meprobamate increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.metaproterenolMonitor Closely (2)metaproterenol and dopamine both decrease sedation. Use Caution/Monitor. metaproterenol and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.methadoneMonitor Closely (1)methadone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.methamphetamineMonitor Closely (2)methamphetamine and dopamine both decrease sedation. Use Caution/Monitor. dopamine and methamphetamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.methoxyfluraneSerious - Use Alternative (1)methoxyflurane increases toxicity of dopamine by Mechanism: unknown. Avoid or Use Alternate Drug. Risk of V tach, HTN.methyldopaMonitor Closely (2)methyldopa increases effects of dopamine by unknown mechanism. Use Caution/Monitor. dopamine and methyldopa both increase dopaminergic effects. Use Caution/Monitor.methylenedioxymethamphetamineMonitor Closely (2)methylenedioxymethamphetamine and dopamine both decrease sedation. Use Caution/Monitor. dopamine and methylenedioxymethamphetamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.methylergonovineMonitor Closely (1)methylergonovine, dopamine. Either increases effects of the other by pharmacodynamic synergism. Use Caution/Monitor. Additive peripheral vasoconstriction.Serious - Use Alternative (1)methylergonovine, dopamine. Mechanism: pharmacodynamic synergism. Contraindicated. Additive vasospasm; risk of hypertension.methylphenidateMonitor Closely (1)dopamine and methylphenidate both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.metoclopramideSerious - Use Alternative (2)metoclopramide decreases levels of dopamine by inhibition of GI absorption. Applies only to oral form of both agents. Contraindicated. metoclopramide decreases levels of dopamine by pharmacodynamic antagonism. Contraindicated.midazolamMonitor Closely (1)midazolam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.midodrineMonitor Closely (2)dopamine and midodrine both decrease sedation. Use Caution/Monitor. dopamine and midodrine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.mirtazapineMonitor Closely (1)mirtazapine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.modafinilMonitor Closely (1)modafinil and dopamine both decrease sedation. Use Caution/Monitor.morphineMonitor Closely (1)morphine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.motherwortMonitor Closely (1)motherwort increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.moxonidineMonitor Closely (1)moxonidine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.nabiloneMonitor Closely (1)nabilone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.nalbuphineMonitor Closely (1)nalbuphine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.nateglinideMonitor Closely (1)dopamine decreases effects of nateglinide by pharmacodynamic antagonism. Use Caution/Monitor. Coadministration may reduce nateglinide's hypoglycemic action.norepinephrineMonitor Closely (2)norepinephrine and dopamine both decrease sedation. Use Caution/Monitor. norepinephrine and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.nortriptylineMonitor Closely (1)nortriptyline increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)nortriptyline, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.olanzapineMonitor Closely (1)olanzapine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)olanzapine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.olodaterol inhaledMonitor Closely (1)dopamine and olodaterol inhaled both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor. Caution with coadministration of adrenergic drugs by any route because of additive sympathetic effectsopticaponeMonitor Closely (1)opicapone will increase the level or effect of dopamine by decreasing metabolism. Use Caution/Monitor. Opicapone is a COMT inhibitor. Caution if coadministered with drugs metabolized by COMT. If coadministered, monitor for changes in heart rate, heart rhythm, and blood pressure.opium tinctureMonitor Closely (1)opium tincture increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.oxazepamMonitor Closely (1)oxazepam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.oxycodoneMonitor Closely (1)oxycodone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.oxymorphoneMonitor Closely (1)oxymorphone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.oxycodone increases effects of dopamine by pharmacodynamic synergism. Use Caution/Monitor.ozanimodSerious - Use Alternative (1)ozanimod increases toxicity of dopamine by sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Avoid or Use Alternate Drug. Because the active metabolite of ozanimod inhibits MAO-B in vitro, there is a potential for serious adverse reactions, including hypertensive crisis. Therefore, coadministration of ozanimod with drugs that can increase norepinephrine or serotonin is not recommended. Monitor for hypertension with concomitant use.paliperidoneMonitor Closely (1)paliperidone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)paliperidone decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.papaveretumMonitor Closely (1)papaveretum increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.pentazocineMonitor Closely (1)pentazocine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.pentobarbitalMonitor Closely (1)pentobarbital increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.perphenazineMonitor Closely (2)perphenazine, dopamine. Mechanism: unknown. Use Caution/Monitor. Risk of cardiac arrhythmia or sudden death, more likely w/thioridazine than other phenothiazines. Interaction more likely in certain predisposed pts. only. perphenazine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)perphenazine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.phendimetrazineMonitor Closely (2)dopamine and phendimetrazine both decrease sedation. Use Caution/Monitor. dopamine and phendimetrazine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.phenelzineContraindicated (1)phenelzine increases effects of dopamine by pharmacodynamic synergism. Contraindicated. Risk of acute hypertensive episode.phenobarbitalMonitor Closely (1)phenobarbital increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.phentermine and dopamine both decrease sedation. Use Caution/Monitor. dopamine and phentermine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.phenylephrineMonitor Closely (2)dopamine and phenylephrine both decrease sedation. Use Caution/Monitor. dopamine and phenylephrine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.phenylephrine POMonitor Closely (2)dopamine and phenylephrine PO both decrease sedation. Use Caution/Monitor. dopamine and phenylephrine PO both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.phenytioninSerious - Use Alternative (1)phenytionin, dopamine. Mechanism: pharmacodynamic synergism. Avoid or Use Alternate Drug. Increased risk of hypotension.pholcodineMonitor Closely (1)pholcodine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.pimozideMonitor Closely (1)pimozide increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)pimozide decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.pirbuterolMonitor Closely (2)pirbuterol and dopamine both decrease sedation. Use Caution/Monitor. pirbuterol and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.ponesimodSerious - Use Alternative (1)ponesimod, dopamine. Either increases effects of the other by pharmacodynamic synergism. Avoid or Use Alternate Drug. Consult cardiologist if considering treatment. Coadministration of ponesimod with drugs that decrease HR may have additive effects on decreasing HR and should generally not be initiated in these patients.primidoneMonitor Closely (1)primidone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.procarbazineMonitor Closely (1)procarbazine increases effects of dopamine by pharmacodynamic synergism. Use Caution/Monitor. Risk of acute hypertensive episode.prochlorperazineMonitor Closely (2)prochlorperazine, dopamine. Mechanism: unknown. Use Caution/Monitor. Risk of cardiac arrhythmia or sudden death, more likely w/thioridazine than other phenothiazines. Interaction more likely in certain predisposed pts. only. prochlorperazine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)prochlorperazine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.promazineMonitor Closely (1)promazine, dopamine. Mechanism: unknown. Use Caution/Monitor. Risk of cardiac arrhythmia or sudden death, more likely w/thioridazine than other phenothiazines. Interaction more likely in certain predisposed pts. only.promethazineMonitor Closely (2)promethazine, dopamine. Mechanism: unknown. Use Caution/Monitor. Risk of cardiac arrhythmia or sudden death, more likely w/thioridazine than other phenothiazines. Interaction more likely in certain predisposed pts. only. promethazine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)promethazine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.propylhexedrineMonitor Closely (2)dopamine and propylhexedrine both decrease sedation. Use Caution/Monitor. dopamine and propylhexedrine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.protriptylineMonitor Closely (1)protriptyline increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)protriptyline, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.pseudoephedrineMonitor Closely (1)dopamine and pseudoephedrine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.quazepamMonitor Closely (1)quazepam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.quetiapineMonitor Closely (1)quetiapine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)quetiapine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.rasagilineMonitor Closely (1)rasagiline increases effects of dopamine by pharmacodynamic synergism. Use Caution/Monitor. Risk of acute hypertensive episode.risperidoneMonitor Closely (1)risperidone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)risperidone decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.sageMinor (1)sage increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Minor/Significance Unknown.salmeterolMonitor Closely (2)salmeterol and dopamine both decrease sedation. Use Caution/Monitor. salmeterol and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.scullcapMonitor Closely (1)scullcap increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.temazepamMonitor Closely (1)temazepam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.terbutalineMonitor Closely (2)terbutaline and dopamine both decrease sedation. Use Caution/Monitor. terbutaline and dopamine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.thioridazineMonitor Closely (2)thioridazine, dopamine. Mechanism: unknown. Use Caution/Monitor. Risk of cardiac arrhythmia or sudden death, more likely w/thioridazine than other phenothiazines. Interaction more likely in certain predisposed pts. only. thioridazine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)thioridazine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.thiothixeneMonitor Closely (1)thiothixene increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)thiothixene decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.tolcaponeMonitor Closely (1)tolcapone will increase the level or effect of dopamine by decreasing metabolism. Use Caution/Monitor. Tolcapone is a COMT inhibitor. Caution if coadministered with drugs metabolized by COMT. If coadministered, monitor for changes in heart rate, heart rhythm, and blood pressure.topiramateMonitor Closely (1)topiramate increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Modify Therapy/Monitor Closely tramadolMonitor Closely (1)tramadol increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.tranylcypromineContraindicated (1)tranylcypromine increases effects of dopamine by pharmacodynamic synergism. Contraindicated. Risk of acute hypertensive episode.trazodoneMonitor Closely (1)trazodone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)trazodone, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.triazolamMonitor Closely (1)triazolam increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.triclofosMonitor Closely (1)triclofos increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.trifluoperazineMonitor Closely (2)trifluoperazine, dopamine. Mechanism: unknown. Use Caution/Monitor. Risk of cardiac arrhythmia or sudden death, more likely w/thioridazine than other phenothiazines. Interaction more likely in certain predisposed pts. only. trifluoperazine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)trifluoperazine decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.trilaciclibSerious - Use Alternative (1)trilaciclib will decrease the level or effect of dopamine by Other (see comment). Avoid or Use Alternate Drug. Avoid coadministration of trilaciclib (OCT2, MATE1, and MATE-2K inhibitor) with substrates where minimal increased concentration in kidney or blood may lead to serious or life-threatening toxicities. trimipramineMonitor Closely (1)trimipramine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)trimipramine, dopamine. Other (see comment). Avoid or Use Alternate Drug. Comment: Tricyclic antidepressants increase or decrease effects of sympathomimetics, by blocking reuptake of NE, or blocking uptake of indirect sympathomimetics into the adrenergic neuron.triprolidineMonitor Closely (1)triprolidine increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.vandetanibMonitor Closely (1)vandetanib increases levels of dopamine by Other (see comment). Modify Therapy/Monitor Closely. Comment: Vandetanib inhibits the uptake of substrates of organic cation transporter 2 (OCT2).xylometazolineMonitor Closely (2)dopamine and xylometazoline both decrease sedation. Use Caution/Monitor. dopamine and xylometazoline both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.yohimbeSerious - Use Alternative (1)yohimbe, dopamine. Mechanism: pharmacodynamic synergism. Contraindicated. Risk of acute hypertensive episode.yohimbineMonitor Closely (2)yohimbine and dopamine both decrease sedation. Use Caution/Monitor. dopamine and yohimbine both increase sympathetic (adrenergic) effects, including increased blood pressure and heart rate. Use Caution/Monitor.ziconotideMonitor Closely (1)ziconotide increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.ziprasidoneMonitor Closely (1)ziprasidone increases and dopamine decreases sedation. Effect of interaction is not clear, use caution. Use Caution/Monitor.Serious - Use Alternative (1)ziprasidone decreases effects of dopamine by pharmacodynamic antagonism. Contraindicated.
